## no 73/2005

### Modification of optimization procedures for the Swedish cut 2 in strained situations

*Nord Pool Spot has received the following information from Svenska Kraftnät:*

In critical power balance situations Svenska Kraftnät will, in order to maintain power system security, temporarily modify the Elspot optimization procedure linked to exports south of cut 2 in Sweden.

In such situations, the export capacity will be reduced for all *individual* interconnectors south of cut 2. The procedure will be carried out equally (pro-rata) for Elspot capacities and all other interconnectors south of cut 2.

When this temporary procedural change is activated, Svenska Kraftnät will send an UMM special information at the latest in the morning before delivery date and when procedures return to normal it will be notified by Svenska Kraftnät via a follow-up UMM.

*Note: This information refers to the Elspot optimization procedure for capacities linked to internal cuts in Sweden and West Denmark that was introduced 15 March 2004 and was informed about in exchange information no 13/2004 19 February 2004.*

Lysaker, 7 December 2005
